

## Listing of Claims.

1. (currently amended) A double containment pipe system, which includes:

a carrier pipe section having a plurality of radially spaced centralizer fins members fixably connected to and longitudinally extending along an outer surface thereof in a manner which prevents movement thereof with respect to said carrier pipe only; and

a containment pipe section having an inner surface of a diameter to contain said carrier pipe and readily permit movement therein, wherein an annulus is formed between the carrier pipe section and containment pipe section such that said carrier pipe and said fins slide as a unit within said containment pipe; and wherein said system is characterized to include a plurality of said carrier pipe sections as defined which are fixably interconnected to one another and which are operably disposed within a plurality of said containment pipe sections which are removably interconnected to one another by a clamp.

2. Cancelled.

3. (currently amended) The double containment pipe system of claim 1, wherein said radially spaced centralizer fins members are generally radially equidistantly spaced from one another.

4. Cancelled.

5. (currently amended) The double containment pipe system of claim 1-4, wherein said containment pipe sections are removably interconnected by clamp is characterized to include a quick connect coupling having a clamp configured to sealably enclose and connect adjacent ends of said connecting containment pipe sections.

6. (original) The double containment pipe system of claim 1, which includes a leak detection device operably disposed within an annulus between said carrier pipe section and said containment

1/  
pipe section adjacent a bottom portion of said containment pipe between said radially extending members.

7. Cancelled.

8. Cancelled.

9. (currently amended) ~~A double containment pipe system, which includes:~~

~~a carrier pipe section; and~~

~~a containment pipe section having a plurality of radially spaced members fixably connected to and longitudinally extending along an inner surface thereof, wherein an inner diameter formed by said radially spaced members to readily movably contain said carrier pipe, and wherein an annulus is formed between the carrier pipe section and containment pipe section which contains said radially spaced members~~

A double containment pipe system, which includes:

a carrier pipe section; and

a containment pipe section having a plurality of radially spaced centralizer fins fixably connected to and longitudinally extending along an inner surface thereof in a manner which prevents movement thereof with respect to said containment pipe only such that said carrier pipe slides on said fins within said containment pipe and providing an inner diameter to contain said carrier pipe and readily permit movement therein, wherein an annulus is formed between the carrier pipe section and containment pipe section; and wherein said system is characterized to include a plurality of said carrier pipe sections as defined which are fixably interconnected to one another and which are operably disposed within a plurality of said containment pipe sections which are removably interconnected to one another by a clamp.

10. Cancelled.

11. The double containment pipe system of claim 9, wherein said radially spaced members are generally radially equidistantly spaced from one another.

12. Cancelled.

13. (currently amended) The double containment pipe system of claim 9, wherein said ~~containment pipe sections are removably interconnected by~~ clamp is characterized to include a quick connect containment coupling having a clamp configured to sealably enclose and connect adjacent ends of said connecting containment pipe sections.

14. (original) The double containment pipe system of claim 9, which includes a leak detection device operably disposed within an annulus between said carrier pipe section and said containment pipe section adjacent a bottom portion of said containment pipe between said radially extending members.

15. Cancelled.
